

HAROLDCOIN: MEME-INSPIRED CRYPTOCURRENCY

Haroldcoin is a GPU mineable cryptocurrency homage inspired by a famous internet celebrity many people have grown to love.

It is a PIVX fork with some modifications, such as POW. It is mixed POW and POS – with 75% going to miners and 25% to masternodes.

One of the biggest benefits of HAROLDCOIN is its very fast yet most importantly extremely cheap transactions!

It is an ASIC-resistant memecoin. We believe mining should be possible for everyone without the need for specialized hardware or investments.

Total supply is set at 100.000.000 HRLD. Block reward is 200 HRLD. Block time is 10 minutes, with a halving every 50.000 blocks (10 million HRLD).

Most importantly, this project is about having fun. 2% of the supply is reserved for Harold, and he is free to take them at any time he so desires.

DECENTRALIZED PEER-TO-PEER NETWORK WHILE HAVING FUN

We believe our mined Haroldcoins are no less real than the infinite printing being done by most of the world's governments at the time. At least computer resources and electricity for the mining creates a base value for something.

Unlike Dollars, Euros, Pounds and other currencies, HRLD actually requires proof-of-work and unlike their inflationary system we believe in a deflationary system.

Why not do this and have fun at the same time?

Money printer may go BRRR, but HRLD sure doesn't.

Also, since we love Harold so much, we believe Harold should be immortalized on the internet, for being one of the most famous memes.

“If some king who once existed can have his face printed on gold coins, for sure Harold who is more worthy deserves to have a modern form to commemorate his greatness.”
